

POWER CLOSE MODULE—

Enables door to fully close against excessive wind pressure or stack pressure (positive or negative).

- Additional Option: Door(s) with emergency breakout ability require a switch to be used, to cancel the power close from a remote location.

NOTE: Power close may be cancelled by a switch within the module enabling a person to push the door manually in open position.

NOTE: All Magic-Access headers with dual control box include this module as part of the standard package.

TIMER MODULE FOR LOCK DELAY—

The timer module is required for any installation that includes an electric strike, magnetic lock or electromechanical lock.

A push plate or motion sensor signals the timer module which in turn signals the lock to unlock. With an option of .3 or 1 second delay, the timer module signals the operator to open the door(s).

A door position switch, within the module, allows immediate opening of the door(s) when not in full closed position.
